EDUCATION

1337 CODING SCHOOL — 42 NETWORK

2023 – PRESENT

Project-based Computer Science curriculum focused on algorithms, systems programming, networking, graphics programming, software engineering, and full-stack development, emphasizing problem-solving and peer-to-peer learning

ISTA ISGI, KHOURIBGA

2021 – 2023

Full Stack Web Development Diploma: Coursework included programming fundamentals, algorithms and data structures, Python development, database systems, modern frontend and backend technologies, and agile project management and software delivery methodologies.

Projects

API Watch: API & Infrastructure Monitoring Platform

- Built a monitoring platform for APIs, servers, and CDNs to track uptime, response times, and service health.
- Implemented automated incident detection and alerting through email and Discord webhooks.
- Developed the monitoring backend and real-time dashboard to provide visibility into service performance and availability.
- Stack: Next.js, TypeScript, NestJS, Prisma, PostgreSQL, Redis, Docker

ft_transcendence: Real-Time Multiplayer Pong Platform

- Built a full-stack multiplayer game platform featuring authentication, matchmaking, real-time games, chat, friends system, live notifications, tournaments, and interactive dashboards.
- Designed and implemented backend APIs and real-time communication with Fastify and WebSockets, using Redis for real-time state and SQLite for persistent application data.
- Integrated blockchain smart contracts to ensure tournament results integrity and immutability.
- Containerized the application with Docker for reproducible development and deployment.
- Stack: Next.js, TypeScript, Tailwind CSS, Radix UI, Fastify, WebSockets, Redis, SQLite, Solidity, Docker, Docker Compose, Nginx

Inception: Multi-Container Infrastructure

- Designed and deployed a multi-container infrastructure using Docker, configuring interconnected services with isolated networks, persistent volumes, and service dependencies.
- Configured and managed Nginx as a reverse proxy and secured services with TLS/HTTPS.
- Automated the environment using Docker Compose for reproducible development and deployment.
- Stack: Docker, Docker Compose, Nginx, Linux, MariaDB, WordPress, PHP.

Movie Recognizer: AI-Powered Movie Identification App

- Built a Flutter app that identifies movies from images, video clips, or text, with movie details enriched through the OMDb API.
- Developed a Fastify backend with JWT authentication and protected AI endpoints, keeping API keys and AI processing server-side.
- Implemented Google Sign-In, watchlists, ratings, watched status, and a credit-based system with subscription options for AI recognition.
- Added client-side image and video compression to reduce upload size and improve recognition performance.
- Stack: Flutter, Dart, Fastify, TypeScript, Prisma, SQLite, Google Gemini, OMDb API

minishell: Unix Shell Implementation

- Developed a Unix shell in C supporting command execution, pipes, redirections, environment variables, built-in commands, and signal handling.
- Implemented command parsing and process management using system calls such as fork, execve, wait, and file descriptors.
- Stack: C, Unix/Linux, Bash, Make

SKILLS AND EXPERTISE

Programming Languages: C, C++, JavaScript, TypeScript, Dart, Python

Frameworks: Next.js, React, NestJS, Fastify, Flutter

Databases: PostgreSQL, MySQL, MongoDB, SQLite, Redis

Systems & DevOps: Linux, Docker, Docker Compose, Nginx, Git, CI/CD, Networking

Security & Backend: REST APIs, JWT, Authentication & Authorization, PostgreSQL RLS

AI-Assisted Development: Claude Code, Cursor, AI coding agents, BMAD Method

LANGUAGES

Arabic: Native | **English:** Advanced (C1) | **French:** Intermediate (B2)
